But since it seemed kind af interesting after giving
it the ance araund, I decided to leave it as is.

Notes

iPS cells. In other words, induced pluripotent stem cells. You can read it up if you'd like, as I'm not knowledgeable enough in biology or stem cell research to give a mini lecture on the topic.

But suffice to say, you can think of it like Kaguya the mouse (with two biological mommy mice).

Trivia: Offspring from same-sex parents via iPS do not necessarily follow the 'logic' behind basic understanding of XX and XY chromosomes. If you search for 'viable female and male mice' on Google and click on the first result, you'll see that it's possible to have both male and female offspring from two daddy mice. While the article gives me the impression that it's currently not possible to have male offspring from two mommies (XX and XX -- no matter how you combine it, you still get XX), it seems like it may be possible later in the future.

Stem cell research is exciting, isn't it? :D

Hope you enJoyed this sequel to Hakka-ya's earlier 兎には特別なこと (Things Special to a Bunny)!
